

Class will start in 5 minutes

Agenda

- ↳ Implement APIs (Contd.)
 - ↳ create a product
 - ↳ get all products ←
- ↳ Response Entity ←
- ↳ Handling Exceptions ←
- ↳

Create a product

Jackson ⇒ library that does conversion of JSON to Java object & vice versa

<pre>class User { id name password role }</pre>	<pre>{ id: — name: — password: — role }</pre>	① Create object user <pre>{ - id - name - password - role ⇒ null }</pre> ↳ ignored by Jackson.
---	--	---

① Create an object of class User

User user = new User();

② For each attr of class User it will check if that attr is present in the json.

List ~~DTO~~.class

List.class

List<Object>
DTO

List <  > ~

is erased.

!!

List l = new

H/W

Implement the following apis:

- Get all products
- Get all categories
- update a product
- delete a product
- get products in specific categories

Break for 5 minutes : 10:27 → 10:32

Apart from data, ~~the~~ api also return:

① Status code

② Headers → will see later.

200
201 → created

404 not found

2xx
- - -

Status Code

→ 1xx: 100, 101, 102, ... → Used for info purposes.

→ 2xx: 200, 201, 202, ... → Success

→ 3xx: redirects

→ 4xx: Client has done something wrong

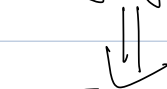

404 ⇒ resource not found

400 ⇒ Bad request ←

→ 5xx: Server side issue

http://google.com

5xx
502 bad gateway

302, https://google.com → browser

404

Exception

↳ message

↳ stack trace

§ Whenever an exception is thrown, spring converts it to a particular JSON & returns to the client (F.E.). if ~~the~~ it is unhandled by the developer.

Problem:

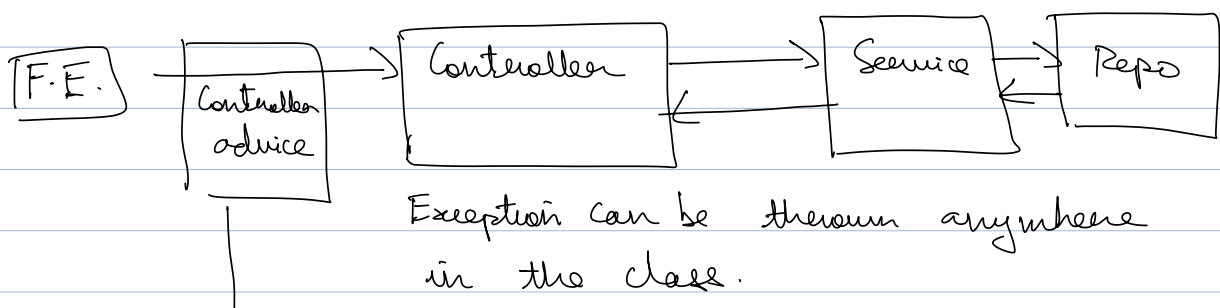

- ① Client won't be able to make sense of it
- ② Shows internal details of the code.

Good practice:

↳ Return a meaningful data:

```
{
  status: 500,
  message: "Service down. Please retry after 10 min"
}
```

- ① Exception handler annotation
- ② Controller Advice

↓
Sits between F.E. and Controller to catch
exceptions thrown by any controller

Focus is to send a clean response to client.
