Q1 Given N array elements. find max subarray sum.
 ↓
 continuous part of an array

e.g. arr[] = ⁰-3 ¹4 ²6 ³8 ⁴-10 ⁵2 ⁶7
 ↳ max subarray sum = 18

arr[] = -3 -2 -8 -1 -10
 ↳ ans = -1

idea1:- Generate all subarrays and get its sum.

s e
 2 5

s <= e

arr[] = ⁰3 ¹-2 ²4 ³6 ⁴3 ⁵2 ⁶7 ⁷2
 e s e e e e e

maxSum = INT_MIN;

```
for (s=0; s < N; s++) {
    // where can my subarray end
    for (e=s; e < N; e++) {
        // [s,e] => subarray fixed
        sum = 0
        for (i=s; i <= e; i++) {
            sum += arr[i];
        }
        maxSum = max(maxSum, sum);
    }
}
```

T.C = $O(N^3)$

S.C = $O(1)$

arr[] = 0 1 2 3 4 5 6 7 8
 3 2 -1 6 4 8 3 -2 7

6 + 4

10 + 8

18 + 3

All subarrays
 starting at index 3

sum = 0 → {0, 1, 2, 3, ..., N-1}
 for (j = 3; j < N; j++) {
 sum = sum + arr[j];
 print(sum);
 }

ans = INT_MIN;

```
for (i = 0; i < N; i++) {
    sum = 0;
    for (j = i; j < N; j++) {
        sum = sum + arr[j];
        ans = max(sum, ans);
    }
}
```

↓
 T.C = $O(N^2)$

S.C = $O(1)$

Observations:-

eg. 1

3 5 6 8 2

if all elements are +ve $\rightarrow$ max subarray sum = sum of arr[]

eg. 2

-2 -8 -9 -11 -10

if all elements are -ve $\rightarrow$ max subarray sum = max element in arr[]

eg. 3

eg. 4

eg. 5

ex. 1.

	0	1	2	3	4	5	6	7	8	9	10	11
	5	6	7	-3	2	-10	-12	8	12	21	-4	7
sum = 0	5	11	18	15	17	7	-5 0	8	20	41	37	44
ans = -∞	5	11	18	18	18	18	18	18	20	41	41	44

↓
ans

Note:- if $sum < 0 \rightarrow sum = 0$

ex. 2

	0	1	2	3	4	5	6	7
	10	-20	-12	6	5	-3	8	-2
sum = 0	10	-10 0	-12 0	6	11	8	16	14
ans = -∞	10	10	10	10	11	11	16	16

→ ans

ex. 3

	0	1	2	3
	-10	-3	-2	-14
sum = 0	-10 0	-3 0	-2 0	-14
ans = -∞	-10	-3	-2	-2

→ ans = -2.

Pseudo Code:-

ans = INT-MIN;

sum = 0;

for (i = 0; i < N; i++) {

sum = sum + arr[i];

ans = max(ans, sum);

if (sum < 0) { sum = 0; }

}

return ans;

T.C = $O(N)$

S.C = $O(1)$

KADANE'S ALGORITHM

Q2 Given an array $arr[N]$.

Initially $arr[i] = 0$.

Return final array after performing all the queries. $\{Q \text{ queries}\}$

Queries $(i, n) =$ Add n to all the numbers from $arr[i]$ to $arr[N-1]$

$arr[i] = \{0\}$

e.g. $A = [0, 0, 0, 0, 0, 0, 0]$ $(i, n): 3 \text{ queries}$

$\downarrow$

	3	3	3	3	3	3	$\rightarrow (1, 3)$
				1	1	1	$\rightarrow (4, -2)$
			4	2	2	2	$\rightarrow (3, 1)$

$A = [0, 3, 3, 4, 2, 2, 2]$

$arr[i] = \{0\}$

e.g. $A = [0, 0, 0, 0, 0, 0, 0]$ $(i, n): 4 \text{ queries}$

$\downarrow$

		6	6	6	6	6	$\rightarrow (2, 6)$
-1	-1	5	5	5	5	5	$\rightarrow (0, -1)$
		7	7	7	7		$\rightarrow (5, 2)$
				11	11		$\rightarrow (5, 4)$

$A = [-1, -1, 5, 7, 7, 11, 11]$

idea 1:- For every query $[i, n]$, iterate from $arr[i] \rightarrow arr[N-1]$ and add n .

$\rightarrow T.C = O(Q \cdot N)$

$S.C = O(1)$

idea 2 :-

arr[7] = {0}

e.g. $A = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$ (i,n): 3 queries

$A = \begin{bmatrix} 0 & 3 & 0 & 1 & -2 & 0 & 0 \end{bmatrix} \rightarrow (1,3)$

↓
Apply p[7] = $\begin{bmatrix} 0 & 3 & 3 & 4 & 2 & 2 & 2 \end{bmatrix} \rightarrow (4,-2)$
 $\rightarrow (3,1)$

arr[7] = {0}

e.g. $A = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$ (i,n): queries

$A = \begin{bmatrix} -1 & 0 & 2 & 2 & 0 & 0 & 0 \end{bmatrix} \rightarrow (2,6)$

↓
Apply p[7] = $\begin{bmatrix} -1 & -1 & 1 & 3 & 3 & 3 & 3 \end{bmatrix} \rightarrow (0,-1)$
 $\rightarrow (5,2)$
 $\rightarrow (2,-4)$

todo → Cross Check

Pseudo code:-

```
int[] modify (int arr[], int N, int Q, int mat[Q][2]) {  
    // Step 1:- Iterate on queries and add value x  
    //           to the array elements.  
    for (l=0; l < Q; l++) {  
        i = mat[l][0]; x = mat[l][1]  
        arr[i] += x;  
    }  
    // Step 2:- Apply PFSum on your modified arr[]  
}
```

↓
for some q^{th} query:-
 $i = mat[q][0]$
 $x = mat[q][1]$

$$T.C = Q * O(1) + O(N) \rightarrow O(N+Q)$$

// directly modifying the i/p array
S.C = prefix in arr[] $\rightarrow$ S.C: $O(1)$

// take entire extra array for prefix
prefix using pf[] $\rightarrow$ S.C = $O(N)$

$arr[N] = 0$ { Perform Q queries and return the final array }

Queries $\rightarrow (i, j, x) =$ Add x to all elements from $arr[i] \rightarrow arr[j]$

idea 1:- for every query $[i, j, x]$, add x for all elements $[i, j]$

$$T.C = O(Q \cdot N)$$

$$S.C = O(1)$$

idea 2:- Optimisation

$$[i, j, x] = [\text{Add } x \text{ from } i \text{ to } N-1], [\text{Add } -x \text{ from } j+1 \text{ to } N-1]$$

$$= \text{Query}(i, x)$$

$$= arr[i] + x$$

$$\text{Query}(j+1, -x)$$

$$arr[j+1] - x$$

Dry Run:-

1) $A[] = [0^0 \ 0^1 \ 0^2 \ 0^3 \ 0^4 \ 0^5 \ 0^6]$

$\begin{matrix} & 2 & 3 & 4 & 5 \\ & 2 & -2 & -3 & \\ & 2 & & 1 & \end{matrix}$

$A[] = [0 \ 2 \ 2 \ 0 \ -2 \ 1 \ -3]$

$\begin{matrix} i & j & x \\ [1 & 3 & 2] \\ [2 & 5 & 3] \\ [2 & 4 & -1] \end{matrix}$

$\rightarrow arr[i] += x$
 $\rightarrow arr[j+1] -= x$

$\downarrow$

Apply $pf[] = [0 \ 2 \ 4 \ 4 \ 2 \ 3 \ 0]$

2) $A[] = [0^0 \ 0^1 \ 0^2 \ 0^3 \ 0^4 \ 0^5 \ 0^6]$

$\begin{matrix} & 2 & 3 & 4 & 5 \\ & 4 & 6 & 2 & -4 & -6 \end{matrix}$

$\downarrow$

$A[] = [0 \ 4 \ 6 \ 2 \ -4 \ -6 \ 0]$

$\begin{matrix} i & j & x \\ [2 & 4 & 6] \\ [3 & 6 & 2] \\ [1 & 3 & 4] \end{matrix}$

$\rightarrow arr[7]$ is out of bounds.
 No need to subtract.

Apply $pf[] = [0 \ 4 \ 10 \ 12 \ 8 \ 2 \ 2]$

Pseudo code:-

```
int[] modify (int arr[], int N, int Q, int mat[Q][3]) {
```

Step1:- Update all queries.

→ $\begin{matrix} 0 & 1 & 2 \\ [i & j & x] \end{matrix}$

```
for (l=0; l<Q; l++) {
```

```
    i = mat[l][0]; j = mat[l][1]; x = mat[l][2];
```

```
    arr[i] += x;
```

```
    if (j+1 < N) {
```

```
        arr[j+1] -= x;
```

```
    }
```

```
}
```

Step2:- Apply prefix sum to modified array

T.C = $O(Q+N)$

S.C = $O(1)$, $O(N)$

↓
use i/p arr ↪ use new array.

Double

$ans = INT_MIN; \text{ int } si = 0, ei = 0$

```
for (i = 0; i < N; i++) {
    sum = 0;
    for (j = i; j < N; j++) {
        sum = sum + arr[j];
        if (sum > ans) {
            si = i, ei = j;
            ans = sum;
        }
    }
}
return ans;
```

i, j

0	1	2	3	4
2	3	9	6	4

$ans = 2$
 $sum = 0, 2, 5$

$arr[j] =$ $\begin{matrix} 1 & 2 & 3 & 4 \\ & 3 & 6 & 10 \end{matrix}$

$(-1) \quad 1 \quad 2 \quad 9 \quad 10$

$-1 \quad -2 \quad -3 \quad (-4)$

$10 \quad 11 \quad (5) \quad 6 \quad 9$
